## 6. 20DB BANDWIDTH MEASUREMENT

### 6.1 LIMITS

The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating above 70 MHz and below 900 MHz. For devices operating above 900 MHz, the emission shall be no wider than 0.5% of the center frequency. Bandwidth is determined at the points 20 dB down from the modulated carrier.

As the center frequency for the device operating is 433.92MHz, thus, the 20dB bandwidth limit is 1.08MHz.

### 6.2 BLOCK DIAGRAM OF TEST SETUP

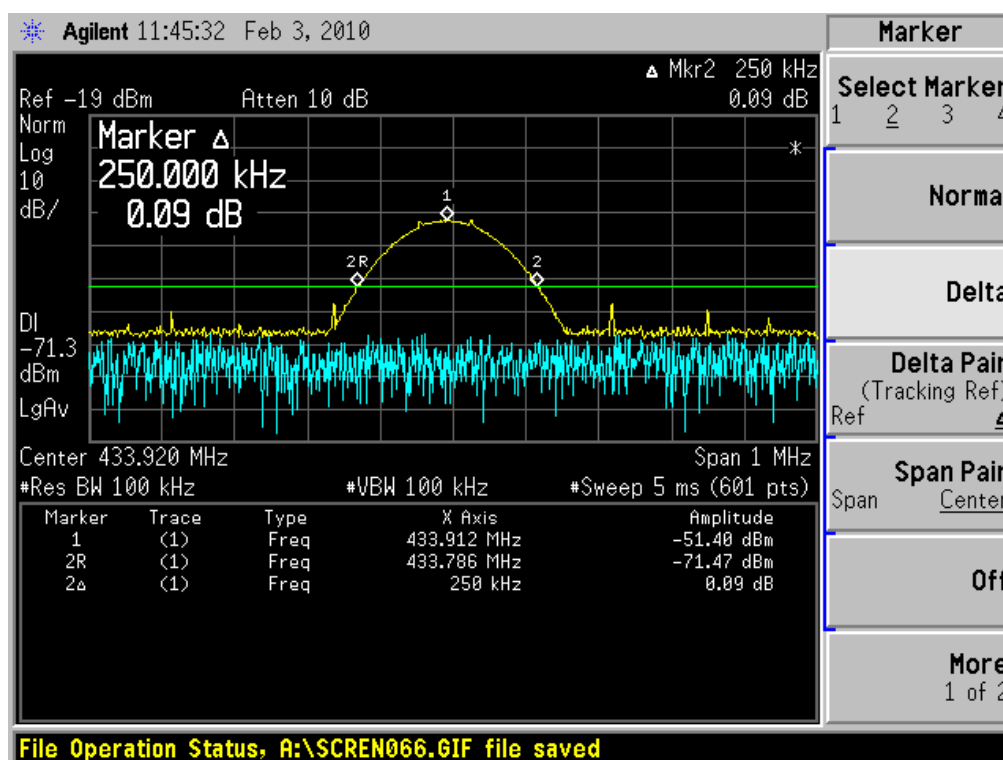

### 6.3 TEST PROCEDURE

1. The transmitter output (antenna port) was connected to the spectrum analyzer.
2. Set spectrum analyzer's RBW and VBW to applicable value with Peak in Max Hold.
3. A PEAK output reading and 20B BW function in spectrum analyzer were taken.

### 6.4 TEST RESULT

Channel	Frequency (MHz)	20dB BW (MHz)	Limit (MHz)	Result (Pass / Fail)
1	433.920	0.250	1.08	Pass

## 7. TIME MEASUREMENT

### 7.1 LIMITS

Devices operated under the provisions of this paragraph shall be provided with a means for automatically limiting operation so that the duration of each transmission shall not be greater than one second and the silent period between transmissions shall be at least 30 times the duration of the transmission but in no case less than 10 seconds.

### 7.2 BLOCK DIAGRAM OF TEST SETUP

### 7.3 TEST PROCEDURE

1. The transmitter output (antenna port) was connected to the spectrum analyzer.
2. Set the center frequency is 433.92MHz and set the Span is 0Hz.
3. Set spectrum analyzer's RBW and VBW to applicable value with Peak.
4. Read the transmission time and silent time from the spectrum analyzer directly.

### 8.2 BLOCK DIAGRAM OF TEST SETUP

For radiated emissions from 9 kHz to 30MHz

For radiated emissions from 30 - 1000MHz

For radiated emissions above 1GHz

## 8.3 TEST PROCEDURE

### A. 30 - 1000MHz

- The EUT was placed on the top of a turntable 0.8 meters above the ground in the chamber, 3 meters away from the antenna (wideband antenna), which was mounted on the top of a variable-height antenna tower. The maximum values of the field strength are recorded by adjusting the polarizations of the test antenna and rotating the turntable.
- For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the turn table was turned from 0 degrees to 360 degrees to find the maximum reading.
- The test frequency analyzer system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

### B. Below 30MHz and Above 1GHz

- The EUT is placed on a turntable 0.8 meters above the ground in the chamber, 1 meter away from the antenna (loop antenna). The maximum values of the field strength are recorded by adjusting the polarizations of the test antenna and rotating the turntable.
- For each suspected emission, the EUT was arranged to its worst case and then turn table was turned from 0 degrees to 360 degrees to find the maximum reading.
- The test frequency analyzer system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

Limit dBμV/m @3m = Limit dBμV/m @300m+ 80

Limit dBμV/m @3m = Limit dBμV/m @30m + 40

**Note 3:**

The transmitter periodically sends a different series of characters, but each packet period (100msec) never exceeds a series of 6 long (0.525msec) and 22 short (0.500msec) pulses. Assuming any combination of short and long pulses may be obtained due to encoding the worst case transmit duty cycle would be considered (6x0.525msec) + (22x0.500msec) per 100msec=14.15% duty cycle.

Duty Cycle Correction =  $20 \log_{10} 0.1415 = -16.98\text{dB}$

The following plots showed the characteristics of the pulse train for one of these functions.
